

**In the Abstract:**

Please amend the abstract as follows:

An exemplary cleaning apparatus for cleaning a system having a first fluid and a system pump is provided, wherein the apparatus comprises a tank including a second fluid, ~~entering the system and cycling in the system with the first fluid for a predetermined period of time.~~ The cleaning apparatus also comprises an apparatus pump for pumping a predetermined amount of the second fluid from the tank into the system while the system pump is off. ~~an air compressor and an air storage tank. The air compressor is capable of compressing air into air storage tank, and air storage tank is capable of delivering air to the system for purging the first and second fluids from the system after the predetermined period of time has expired.~~ The cleaning apparatus further comprises an output hose, a return hose, and a filter between the return hose and the output hose. After the predetermined amount of the second fluid is pumped into the system, the system pump is turned on to pump the first fluid and the second fluid out of the return line through the filter and into the output hose and back into the system. ~~an air regulator capable of regulating pressure of the air delivered to the system.~~
